

PHARMACY SALES & INVENTORY ANALYTICS

MediCore Pharmacy

Turning Six Years of Transaction Data Into Procurement, Market and Inventory Decisions

ANALYSIS PERIOD: 2020 – 2025

Blessing Ogmegbulam • Data Analyst

Excel · SQLite · Power BI

Six Years, 19 Countries, \$4.13 Billion in Revenue

Between January 2020 and December 2025, MediCore Pharmacy sold over 79 million medicine units across 19 countries. Growth was steep in 2020–2021, then revenue flattened from 2022 onward — a maturity signal, not a decline.

WHAT THE DATA IS TELLING US

- Revenue is diversified across regions and categories — no single market or product line dominates.
- But a small group of medicines (Paracetamol, Azithromycin) and the 46–65 age group drive a disproportionate share of sales.
- Inventory is healthy overall (77.9% of stock in the Safe expiry band), yet stock is spread evenly across regions regardless of demand — a misallocation risk.

Growth Has Plateaued, Five Countries Carry the Business

Figure: Executive Overview dashboard — Power BI (Revenue by Year, Country, Region)

INSIGHT

Revenue rose sharply in 2020–2021, then stabilised through 2025. Brazil, UAE, Nigeria, Canada and Germany are the top five revenue markets; the lowest performers earn roughly 35% less than the leaders despite an identical operating model.

RECOMMENDATION

- Set country-specific sales targets tied to historical performance, not a flat global target.
- Run quarterly market reviews to flag stagnating countries early.
- Replicate Brazil/UAE/Nigeria distribution practices in underperforming markets.

A Well-Balanced Portfolio — But Balance Isn't Free

INSIGHT

Categories sit within \$8M of each other (\$821M–\$830M) and regions within \$7M — genuine diversification, not a data artefact. This shields revenue from a single-category or single-region shock.

RECOMMENDATION

Don't fund every category equally. Run monthly reviews combining revenue, units sold and inventory turnover — prioritise procurement budget toward categories that are both high-revenue and fast-turning.

Five Medicines Anchor the Portfolio — and the Risk

Figure: Top 5 medicines by revenue and units sold — Power BI Product & Inventory dashboard

INSIGHT — REVENUE CONCENTRATION

Paracetamol, Azithromycin, Cough Syrup, Multivitamin and Metformin together pull a disproportionate share of revenue and volume. A supplier delay or demand shift on any one of these has an outsized, direct impact on total sales.

STRATEGIC OBSERVATION

High sales volume ≠ high profitability. Azithromycin leads on units sold (7.90M) but Paracetamol leads on revenue (\$417.2M) — unit price, not volume alone, decides which products matter most to the bottom line. Procurement priority should weigh revenue, turnover and demand together.

RECOMMENDATION

- Tier medicines High / Medium / Low by revenue contribution.
- Set automatic reorder points for the top 5 to prevent stockouts.
- Review slow movers quarterly before cutting procurement.

Loyal Core Customers, and an Inventory Allocation Gap

INSIGHT

Customers aged 46–65 generate the most revenue, followed by 65+ — consistent with demand for chronic-condition and preventive medication. Customers 13–25 contribute the least, signalling an underdeveloped younger segment rather than a weak product fit.

INVENTORY EXPIRY STATUS

77.9%

Safe

13.2%

Moderate

8.9%

Critical

798M units in stock, averaging 374 days to expiry. Most inventory is healthy, but Moderate + Critical stock still ties up shelf space while losing value daily.

RECOMMENDATION

- Allocate stock by regional demand, not equally — stock is currently near-identical (~99.8M units) across all 8 regions despite uneven sales.
- Apply First-Expiry-First-Out (FEFO) and run weekly Moderate/Critical expiry reports.
- Launch wellness campaigns aimed at the 13–25 and 26–45 segments to widen the customer base.

From Insight to Action: A Phased Implementation Plan

PHASE 1 — IMMEDIATE (0–3 MONTHS)

- Generate weekly Moderate/Critical expiry reports; apply FEFO
- Set reorder points for the top 5 revenue medicines
- Redistribute near-expiry stock to high-demand regions

PHASE 2 — NEAR-TERM (3–6 MONTHS)

- Shift inventory allocation from equal-by-region to demand-driven
- Launch country-specific promotions in the 5 lowest-revenue markets
- Tier all medicines into High / Medium / Low procurement priority

PHASE 3 — ONGOING (6+ MONTHS)

- Embed the Power BI dashboard into monthly management reviews
- Run preventive-health campaigns to grow the 13–25 / 26–45 segments
- Quarterly category & country performance audits tied to procurement budget

OWNERSHIP: Assign each phase to procurement, regional sales and BI/operations leads respectively; track progress through the existing Power BI dashboard rather than a separate reporting tool.

A Financially Strong Pharmacy — Ready to Get Sharper, Not Bigger

Across 2020–2025, MediCore Pharmacy built \$4.13bn in revenue on a diversified, resilient base of products, regions and customers. The next stage of growth will not come from expanding further — it will come from sharpening what already exists: smarter procurement, demand-driven inventory, FEFO-disciplined expiry management, and market-specific commercial strategy.
